

Cover letter — Bitlica · Backend Vibe Engineer (Golang)

Hi Bitlica team,

I'm applying for the Backend Vibe Engineer (Golang) role.

I want to be straightforward about the fit, because the title says "Vibe" and that's the part where I think I can actually help you.

What I bring:

- Two years of production backend work on Wentmarket (wentmarket.ru), a B2B HVAC platform I built end-to-end with Claude Code. 17 000+ polynomial fan curves in Postgres, sub-100ms duty-point matching, real money flowing through Yookassa, real orders shipping through CDEK. Order pipeline, soft-delete, idempotent payments, headless Bitrix24, 1C sync — all production, all running.
- A working spec-first workflow with AI coding agents. PRD → architecture → per-story acceptance criteria → code → tests → deploy. Not "ask Cursor to autocomplete," but a real loop where the spec gates the implementation and the AI is the productivity multiplier through every stage. BMad-style.
- Six years of HVAC engineering before the web stack — useful when the domain is technical (which a lot of backend work is).

What I don't bring (yet):

- Production Go. My primary stack is TypeScript/Node. To close the gap I built a real Go service in this same spec-driven style: github.com/goncharovart/fan-selector-api. Distroless image, embedded SQL migrations, OTel traces, GitHub Actions CI, spec docs in `/specs`. Deployment configs for both Cloud Run and Fly.io are committed (`cloudbuild.yaml` , `fly.toml`) — ready to ship the moment a billing account is attached. Locally it runs end-to-end via `docker compose up -d && go run ./cmd/server`.
- Hands-on GCP/GKE production. I've written GCP deploy configs and read the docs end-to-end, but haven't operated a cluster in prod. The primitives (containers, secrets, IAM, managed Postgres/Redis) are familiar from self-hosted setups; the muscle memory will come fastest by doing.

Why this role:

"Vibe Engineer" is the right name for what I already do. Most of the "experienced senior" backend candidates you'll see have never shipped real production with AI agents in the loop. I have. The Wentmarket repo is the artifact; the fan-selector-api repo is the proof I can do it in your stack.

I'd value a 30-minute call to go through both repos with you and to learn what Bitlica's "AI-native workflow" looks like in practice.

Open to relocation (Poland / Georgia / Belarus / other). Available immediately.
